Ammonia	mg/L (Note 1)	Daily during any discharge	1	30/06/2016	3.8	nil
Exceedance Information	The above laboratory result does not align with what was recorded on site using the Lovibond 2000 Tintometer (i.e. 0.2 mg/L) which led to the decision to discharge the basin. KEE had the sample reanalysed by the laboratory which returned the same result. The discrepancy may be due to a number of reasons, such as sample contamination, incorrect on-site measurement, laboratory error, etc. When investigated it was found that required procedures for sediment basin management and water sampling were adhered to. The discrepancy between on-site testing and laboratory analysis is unusual and it is the first time that there has been a discrepancy which has led to an exceedance of an ammonia limit. KEE have since purchased a Horiba D-73G Ion Meter that will be used to more precisely check the level of ammonia in surface water samples prior to discharge to reduce the likelihood of a recurrence of this type of non-compliance.
